C4L Intelligence Systems

A member of the IRI corporate family

Globally providing solutions satisfying extraordinary requirements

We design, deliver and operate special technologies for our Clients.

All of our work is based upon serving the Client with a set of customized, optimized and personalized tools that enhance operational intelligence for business or personal needs and desires.

We employ the latest in proven and reliable technologies, whatever they may be. We separate research and development from our product line. Our Clients receive systems and services that are reliable, fault-tolerant, fail-safe, totally secure and exclusive for their applications. Our technology employs and is compatible with a very large set of consumer-oriented and standardized products within domains of IoT/AIoT, home electronics, mobile computing, and many robotic systems for use on land, indoors, and in airborne or maritime environments.

We have three divisions that comprise our corporate forces.

IIS   AIS   SAS

IIS

Integrative Intelligence Systems

We design, build, and manage specialized systems that employ our proprietary architecture and methodology for different applications serving companies and organizations. These systems are known as *C4L Networks*.

SPS – a system that integrates shipboard, airborne, ground-based, and satellite data streams for real-time surveillance and security of ships and their crews and cargos when at sea or in port. We employ multi-spectral optical and other forms of sensing and monitoring. We provide defensive countermeasures against attack by hostile agents and forces. We provide systems that can be employed anywhere on any type of vessel or for a fleet of ships. SPS is highly customizable to the changing needs of shipowners and operators.

INT – five specialized C4L Network systems, each of which is customized for the Client. These include specialized systems for consumers and their homes, with a focus upon enhancing personal and family health, safety, security, and simultaneously, uplifting and energizing a vital and pleasurable lifestyle. We incorporate energy, security, appliance, vehicle, media, and a powerful suite of health-focused and safety/security-focused devices and their control applications in manners suiting the personalities and needs of our Clients:

IntelAgros – agriculture   IntelErgy – rural energy   IntelEnvir – environmental management

IntelCasa ("SmartLife", "SmartHome") – home and yard   IntelVia – travel and voyage

The INT systems are fully compatible with one another and together they learn and adapt in ways that increase their intelligence capabilities for serving the needs of each Client, while ensuring the absolute

privacy and information integrity of each Client. All personal or corporate data that is generated or received within any C4L network products and services is fully ensured to be private and inaccessible to anyone except those authorized by the Client.

AIS

Aegis Information Securities

We provide a service to Clients that is unique and unparalleled in our world. AIS serves as a private information securities bank and trust, more than a data haven, more than a brokerage, more than cybersecurity as it has been known and practiced up to date. AIS enables an individual or company to protect essential data through our proprietary methods of encryption which are unbreakable by any known form of decryption including nation-state supercomputers or novel quantum computers. In addition, AIS enables the owner of any essential data to engage in trading such data objects as financial securities with other buyers, sellers and traders worldwide. C4L Intelligence Systems, through its AIS unit, acts as broker on behalf of its Clients, if such services are desired. In any case, data secured and banked within AIS is impenetrable, uncompromisable, and perpetually private and secure.

SAS

Special Action Services

We assist Clients in the analysis of their particular challenges and options. We design and deliver Special Operation Projects that employ our science, technology, engineering, psychological, and socioeconomic assets in order to provide concise critical intelligence. We develop specific solutions for problems that otherwise create significant risks and dangers. Our Projects involve the adroit application and integration of human and machine intelligence on all levels. We employ the same refined methods and tools of communication, concurrency, collaboration and control that re the essence of our C4L Network intelligence systems.
